### Abstract

A mouth switch arrangement is proposed which comprises a  
mouth switch (69, 71) for operation with the operators`  
10 mouth and which by means of a holding device is attachable  
to a base part (111). The holding device comprises a mouth  
switch support (73) having a locking member (93)  
longitudinally shiftable along a rod (67) of the holding  
device and a pivot member (95) pivotable about the locking  
15 member (93).

The mouth switch is preferably provided for use on a  
surgical stereo microscope.
